
The paper as a whole, once: was it worth building?
Step back and ask, for example: What's new here? Why should it hold? Who cares?
What the paper adds
rests on the statements
Every statement, one at a time: is it built right?
It cites a study
Look it up: does the study exist, and does it really say this?
It assumes something
Say so openly, and note whether others agree
It reports the author's own work
Describe it so someone else could do it again
It builds on other statements
Check the step: does it follow? Is it enough? Is the best objection answered?
The statement
worded as surely as allowed
How sure may it sound? As sure as its weakest link. Shows only once someone else has checked it
